

## REFURBISHING SERVICES

The NCD Medical refurbishing center is equipped and staffed to recondition most radiology diagnostic equipment. We use the same process for your equipment as we do for ours. When the equipment is brought into our Ohio facility it is inspected from top to bottom. We look for worn parts, bad cables, weak power, etc. We then replace any parts that appear excessively worn. Finally we retest, calibrate, clean and paint the unit. You have the option to replace older tubes, image intensifiers, batteries, etc...

The process, although extremely thorough, is generally less expensive than acquiring a replacement unit. We provide you a price to refurb after our initial inspection but prior to proceeding. We will provide various options and will not proceed until you have approved our proposal. Most units can be completed in 2-4 weeks; however, large projects and parts availability can slow down completion. We will keep you informed and can provide short term rental equipment when available.

NCD Medical refurbishing services may be just what the doctor ordered when quality equipment needs a new life.
